

# Chapter 3

## Growth of functions

### 3 Growth of functions

MergeSort beats InsertionSort ?

$$\Theta(n \lg n) = c_1 n \lg n < \Theta(n^2) = c_2 n^2 ?$$

How's  $100n \lg n$  vs  $3n^2$  ? ( $n = 2$ :  $100n \lg n = 200 > 3n^2 = 27$ )

We say  $n \rightarrow \infty$ , MergeSort  $\Theta(n \lg n)$ , beats InsertionSort  $\Theta(n^2)$ .

#### Overview

- A way to describe behavior of functions **in the limit**. We're studying **asymptotic efficiency**.  
(函数的渐近效率)
- Describe **growth** of functions
- Focus on what's important by abstracting away low-order terms and constant factors.  
(通常忽略低阶项和常数因子)
- How we indicate running times of algorithms. (如何描述算法的运算时间)
- A way to compare "sizes" of functions

$$o \approx < ; O \approx \leq ; \Theta \approx = ; \Omega \approx \geq ; \omega \approx >$$

### 3.1 Asymptotic notation

---

- the asymptotic running time are defined in terms of functions whose domains are the set of **natural numbers**  $N = \{0, 1, 2, \dots\}$ .  
(运行时间函数的定义域为自然数集)
- **Abuse(“特用, 泛用”)**
  - ◆ just for convenient
  - ◆ for example, extended to the real numbers domain
- **Not misused(误用、错用)**
  - ◆ We need understand the precise meaning of the notation when it is abused. It is not misused.

### 3.1.1 $\Theta$ -notation: asymptotically tight bound (渐近紧界)

What this notation  $T(n) = \Theta(n^2)$  means

For a given function  $g(n)$ , we denote by  $\Theta(g(n))$  the set of functions

$$\Theta(g(n)) = \{ f(n) : \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that} \\ 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0 \}.$$

We could write “ $f(n) \in \Theta(g(n))$ ” to indicate that  $f(n)$  is a member of  $\Theta(g(n))$ .

Instead, we will usually write “ $f(n) = \Theta(g(n))$ ” to express the same notion. The abuse may at first appear confusing, but it has advantages.

$$f(n) = \Theta(g(n)) \text{ indicates } f(n) \in \Theta(g(n))$$

### 3.1.1 $\Theta$ -notation: asymptotically tight bound (渐近紧界)

$$T(n) = \Theta(n^2)$$

For a given function  $g(n)$ , we denote by  $\Theta(g(n))$  the set of functions

$$\Theta(g(n)) = \{ f(n): \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that} \\ 0 \leq c_1g(n) \leq f(n) \leq c_2g(n) \text{ for all } n \geq n_0 \}.$$

(a)

(b)

(c)

We say that  $g(n)$  is an asymptotically tight bound for  $f(n)$ .

### 3.1.1 $\Theta$ -notation: asymptotically tight bound (渐近紧界)

$\Theta(g(n)) = \{f(n): \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that}$   
 $0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0 \}.$

- Assume that every asymptotic notations are **asymptotically nonnegative**.  
(设所有的渐近符号为渐近非负)
- Example: How to show that  $n^2/2 - 3n = \Theta(n^2)$  ?

We must determine positive constants  $c_1, c_2$ , and  $n_0$  such that

$$c_1 n^2 \leq n^2/2 - 3n \leq c_2 n^2 \implies c_1 \leq 1/2 - 3/n \leq c_2$$

by choosing  $c_1 = 1/14$ ,  $c_2 = 1/2$ , and  $n_0 = 7$ , we can verify that  $n^2/2 - 3n = \Theta(n^2)$

- Other choices for the constants may exist. The key is **some choice exists**.

### 3.1.1 $\Theta$ -notation: asymptotically tight bound (渐近紧界)

---

$\Theta(g(n)) = \{f(n): \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that}$   
 $0 \leq c_1g(n) \leq f(n) \leq c_2g(n) \text{ for all } n \geq n_0 \}.$

How verify that  $6n^3 \neq \Theta(n^2)$  ?

Suppose for the purpose of contradiction that  $c_2$  and  $n_0$  exist such that  $6n^3 \leq c_2n^2$  for all  $n \geq n_0$ . But then  $n \leq c_2 / 6$ , which cannot possibly hold for arbitrarily large  $n$ , since  $c_2$  is constant.

### 3.1.1 $\Theta$ -notation: asymptotically tight bound (渐近紧界)

$\Theta(g(n)) = \{f(n): \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that}$   
 $0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0 \}$ .

- The **lower-order terms**, the **coefficient of the highest-order term** can be ignored.
- Example:  $f(n) = an^2 + bn + c$ , where  $a > 0$ ,  $b, c$  are constants.

Throwing away the lower-order terms and ignoring the constant yields

$$f(n) = an^2 + bn + c \quad \Longrightarrow \quad f(n) = \Theta(n^2)$$

- In general, for any polynomial  $p(n) = \sum_{i=0}^d a_i n^i$ , where the  $a_i$  are constants and  $a_d > 0$ , we have  $p(n) = \Theta(n^d)$ .
- We can express any constant function as  $\Theta(n^0)$  or  $\Theta(1)$ .  
 $\Theta(1)$  often mean either a constant or a constant function.

### 3.1.2 $O$ -notation: asymptotic upper bound (渐近上界)

**$O$  – notation:** For a given function  $g(n)$ , we denote by  $O(g(n))$  the set of functions  $O(g(n)) = \{f(n): \text{there exist positive constants } c \text{ and } n_0 \text{ such that } 0 \leq f(n) \leq c g(n) \text{ for all } n \geq n_0\}$ .

- " $f(n) = O(g(n))$ " indicates " $f(n) \in O(g(n))$ "
- $f(n) = \Theta(g(n)) \Rightarrow f(n) = O(g(n))$   
 $\Rightarrow \Theta(g(n)) \subseteq O(g(n))$

$O$  表示的范围更大,  $\Theta$  表示更精确

### 3.1.2 $O$ -notation: asymptotic upper bound (渐近上界)

**$O$  – notation:** For a given function  $g(n)$ , we denote by  $O(g(n))$  the set of functions  $O(g(n)) = \{f(n): \text{there exist positive constants } c \text{ and } n_0 \text{ such that } 0 \leq f(n) \leq c g(n) \text{ for all } n \geq n_0\}$ .

- Example:  $2n^2 = O(n^3)$ , with  $c = 1$  and  $n_0 = 2$
- Example of functions in  $O(n^2)$

$$n$$

$$n / 3000$$

$$n^{1.99999}$$

$$n^2 / \lg \lg \lg n$$

$$n^2$$

$$n^2 + n$$

$$n^2 + 2000n$$

$$500n^2 + 1000n$$

### 3.1.3 $\Omega$ -notation: asymptotic lower bound (渐近下界)

**$\Omega$  – notation:** For a given function  $g(n)$ , we denote by  $\Omega(g(n))$  the set of functions  $\Omega(g(n)) = \{ f(n) : \text{there exist positive constants } c \text{ and } n_0 \text{ such that } 0 \leq c g(n) \leq f(n) \text{ for all } n \geq n_0 \}$ .

### 3.1.3 $\Omega$ -notation: asymptotic lower bound (渐近下界)

**$\Omega$  – notation:** For a given function  $g(n)$ , we denote by  $\Omega(g(n))$  the set of functions  $\Omega(g(n)) = \{ f(n) : \text{there exist positive constants } c \text{ and } n_0 \text{ such that } 0 \leq c g(n) \leq f(n) \text{ for all } n \geq n_0 \}$ .

Example of functions in  $\Omega(n^2)$

$$n^3$$

$$n^{2.00000001}$$

$$n^2 \lg \lg \lg n$$

$$n^2$$

$$n^2 - n$$

$$n^2 - 2000n$$

$$0.3n^2 - 1000n$$

### 3.1.3 $\Omega$ -notation: asymptotic lower bound (渐近下界)

#### □ Theorem 3.1

For any two functions  $f(n)$  and  $g(n)$ , we have  $f(n) = \Theta(g(n))$  if and only if  $f(n) = O(g(n))$  and  $f(n) = \Omega(g(n))$ .

**Prove:**  $\Rightarrow$ :  $f(n) = \Theta(g(n))$ , then  $\exists c_1 > 0, c_2 > 0, n_0 > 0$ ,  
s.t.  $n \geq n_0$ ,  $0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n)$   
then  $n \geq n_0$ ,  $0 \leq f(n) \leq c_2 g(n) \Rightarrow f(n) = O(g(n))$   
then  $n \geq n_0$ ,  $0 \leq c_1 g(n) \leq f(n) \Rightarrow f(n) = \Omega(g(n))$   
 $\Leftarrow$ :  $f(n) = O(g(n))$ , then  $\exists c_2 > 0, n_{20} > 0$ ,  
s.t.  $n \geq n_{20}$ ,  $0 \leq f(n) \leq c_{20} g(n)$   
 $f(n) = \Omega(g(n))$ , then  $\exists c_{10} > 0, n_{10} > 0$ ,  
s.t.  $n \geq n_{10}$ ,  $0 \leq c_{10} g(n) \leq f(n)$   
let  $n_0 = \max\{n_{10}, n_{20}\}$ , then  $n \geq n_0$ ,  
 $0 \leq c_{10} g(n) \leq f(n) \leq c_{20} g(n)$ , that is  $f(n) = \Theta(g(n))$ .

### 3.1.3 $\Omega$ -notation: asymptotic lower bound (渐近下界)

#### Theorem 3.1

For any two functions  $f(n)$  and  $g(n)$ , we have  $f(n) = \Theta(g(n))$  if and only if  $f(n) = O(g(n))$  and  $f(n) = \Omega(g(n))$ .

In practice, rather than using the theorem to obtain asymptotic upper and lower bounds from asymptotically tight bounds, we usually use it to **prove** asymptotically tight bounds from asymptotic upper and lower bounds.

(定理作用：实际中，通常根据渐近上界和渐近下界来证明渐近紧界，而不是根据渐近紧界来得到渐近上界和渐近下界。)

### 3.1.3 $\Omega$ -notation: asymptotic lower bound (渐近下界)

---

- The running time of insertion sort falls between  $\Omega(n)$  and  $O(n^2)$ , the bounds are asymptotically tight.
- The running time of insertion sort is not  $\Omega(n^2)$ . Why?
- It is not contradictory to say that the **worst-case running time** of insertion sort is  $\Omega(n^2)$ . Why?
- The running time of an algorithm is  $\Omega(g(n))$ , we mean that no matter what particular input of size  $n$  is chosen for each value of  $n$ , the running time on that input is at **least** a constant times  $g(n)$ , for large  $n$ .  
( 算法的运行时间为 $\Omega(g(n))$ 意味着对足够大的 $n$ , 对输入规模为  $n$  的任意输入, 其运算时间至少是 $g(n)$ 的一个常数倍, 即,  $g(n)$ 是算法计算时间的下界。 )

### 3.1.4 $o$ -notation: upper bound but not asymptotically tight

---

- The bound provided by  $O$ -notation **may or may not** be asymptotically tight.
- The bound  $2n^2 = O(n^2)$  is asymptotically tight, but the bound  $2n = O(n^2)$  is not.
- The  $o$ -notation denotes an **upper bound** that is **not asymptotically tight** (非渐近紧的上界) .  
Formally, define  $o(g(n))$  as the set

$o(g(n)) = \{f(n): \text{for any positive constants } c > 0, \text{ there exists a constant } n_0 > 0 \text{ such that } 0 \leq f(n) < c g(n) \text{ for all } n \geq n_0\}.$

For example,  $2n = o(n^2)$ , but  $2n^2 \neq o(n^2)$ .

### 3.1.4 $o$ -notation: upper bound but not asymptotically tight

$o(g(n)) = \{f(n): \text{for any positive constants } c > 0, \text{ there exists a constant } n_0 > 0 \text{ such that } 0 \leq f(n) < c g(n) \text{ for all } n \geq n_0\}.$

- The definitions of  $O$ -notation and  $o$ -notation are **similar**.
- The main difference
  - ◆ In  $f(n) = O(g(n))$ , the bound  $0 \leq f(n) \leq c g(n)$  holds for **some** constant  $c > 0$
  - ◆ In  $f(n) = o(g(n))$ , the bound  $0 \leq f(n) < c g(n)$  holds for **all** constant  $c > 0$
- $f(n) = o(g(n))$ : intuitively, in the  $o$ -notation, the function  $f(n)$  becomes **insignificant** relative to  $g(n)$  as  $n$  approaches infinity; that is

$$\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = 0$$

### 3.1.5 $\omega$ -notation: lower bound but not asymptotically tight

- $\omega$ -notation is to  $\Omega$ -notation as  $o$ -notation is to  $O$ -notation.
- The  $\omega$ -notation denotes an **lower bound** that is **not asymptotically tight**. Formally, define  $\omega(g(n))$  as the set

$\omega(g(n)) = \{ f(n) : \text{for any positive constants } c > 0, \text{ there exists a constant } n_0 > 0 \text{ such that } 0 \leq c g(n) < f(n) \text{ for all } n \geq n_0 \}.$

One way to define it is by

$f(n) \in \omega(g(n))$  if and only if  $g(n) \in o(f(n))$

For example,  $n^2/2 = \omega(n)$ , but  $n^2/2 \neq \omega(n^2)$ .

- The relation  $f(n) = \omega(g(n))$  implies that  $\lim_{n \rightarrow \infty} \frac{f(n)}{g(n)} = \infty$ , if the limit exists.

### 3.1.6 Comparison of functions

---

- Many of the relational properties of **real number** apply to asymptotic comparisons.

- **Transitivity (传递性)**

$f(n) = \Theta(g(n))$  and  $g(n) = \Theta(h(n))$  imply  $f(n) = \Theta(h(n))$ ,

$f(n) = O(g(n))$  and  $g(n) = O(h(n))$  imply  $f(n) = O(h(n))$ ,

$f(n) = \Omega(g(n))$  and  $g(n) = \Omega(h(n))$  imply  $f(n) = \Omega(h(n))$ ,

$f(n) = o(g(n))$  and  $g(n) = o(h(n))$  imply  $f(n) = o(h(n))$ ,

$f(n) = \omega(g(n))$  and  $g(n) = \omega(h(n))$  imply  $f(n) = \omega(h(n))$ .

### 3.1.6 Comparison of functions

---

- Reflexivity (自反性)

$$f(n) = \Theta(f(n)),$$

$$f(n) = O(f(n)),$$

$$f(n) = \Omega(f(n)).$$

- Symmetry (对称性)

$$f(n) = \Theta(g(n)) \text{ if and only if } g(n) = \Theta(f(n)).$$

- Transpose symmetry (反对称性)

$$f(n) = O(g(n)) \text{ if and only if } g(n) = \Omega(f(n)),$$

$$f(n) = o(g(n)) \text{ if and only if } g(n) = \omega(f(n)).$$

### 3.1.6 Comparison of functions

An analogy between the asymptotic comparison of two functions and the comparison of two real numbers

(函数渐近性比较与实数比较的类比)

$$f(n) = o(g(n)) \rightarrow f(n) < g(n) \leftrightarrow a < b,$$

$$f(n) = O(g(n)) \rightarrow f(n) \leq g(n) \leftrightarrow a \leq b,$$

$$f(n) = \Theta(g(n)) \rightarrow f(n) = g(n) \leftrightarrow a = b,$$

$$f(n) = \Omega(g(n)) \rightarrow f(n) \geq g(n) \leftrightarrow a \geq b,$$

$$f(n) = \omega(g(n)) \rightarrow f(n) > g(n) \leftrightarrow a > b.$$

### 3.1.6 Comparison of functions

**One property of real numbers, does not carry over to asymptotic notation**

- ◆ **Trichotomy** (三分法) : any two real numbers  $a$  and  $b$ , one of the following must hold:  $a < b$ ,  $a = b$ , or  $a > b$ .
- ◆ Not all functions are asymptotically comparable. That is, for two functions  $f(n)$  and  $g(n)$ , it may be the case that neither  $f(n) = O(g(n))$  nor  $f(n) = \Omega(g(n))$  holds.

For example, the functions  $n$  and  $n^{1+\sin n}$  cannot be compared using asymptotic notation.

$$-1 \leq \sin n \leq 1 \Rightarrow n^0 \leq n^{1+\sin n} \leq n^2$$

$$n^{1+\sin n} \leq n \leq n^{1+\sin n} \quad ???$$
